Screening an isolated protein for Nematode-extracted Anticoagulant Protein domains.

Disclosure; Col 142-144; 197pp; English.

The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo

```
activated partial thromboplastin time (aPTT) assay; calculating prolongation of clotting effected by the isolated protein in each of the T and aPTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity
                                                                                                                                                                                                                9
                                                                                                                                                                                                                                       9

New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.

Example A; Fig 16; 197pp; English.

The present sequence is the Ancyclostoma caninum nematode-extracted anticoagalant protein AcaNAPc2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the

isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, anglina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against nematode parasites. (Updated on 06-AUG-2003 to correct OS field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  isolated from nematodes, are useful to inhibit blood coagulation. The proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit thrombosis, and may be given alone or in combination with other therapeutic or in vivo diagnostic agents. The proteins can serve as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Proteins with anticoagulant and/or serine protease inhibitory activity,

immunogens to raise antibodies for use in the diagnosis and identification of NAP concn. levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm. They can also be used as immunogens in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in prothrombin time assays when present at 10-50 µMol, and double the clotting time of human plasma in activated partial thrombin time assays when present at 10-100 nMol. The anticoagulant proteins are pref. derived from Ancylostorma cannium, A. devlandcum, A. dudenale, Necator americanus or Heligomosmoides polygyrus. The proteins pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor VIIa/TF complex in the presence of factor Xa or a catalytically inactive factor Xa derived derive, do not specifically inhibit the activation of factor VIIa in the absence of TF and do not specifically inhibit prothrombinase. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 91 AA;

New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.

ö The present sequence is the Ancyclostoma canimum nematode-extracted anticoagulant protein AcaNAPc2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against nematode parasites.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                                                                                                                                                                                                                       à
```

The present sequence represents a nematode extracted anticoagulant

```
protein (NAP). The protein has activity as an anticoagulant and/or serine protease inhibitor. The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for for factor VIIa/TF selective inhibitory activity. The method comprises contemning the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo cutivated partial thromboplastin time (aPTT) assay, calculating prolongation of clotting effected by the isolated protein in each of PT and aPTT assay, with respect to a baseline clotting value for each or sasay, where prolongation of clotting is calculated as fold elevation of clotting time is deemed a two-fold elevation; and calculating a PT to aPTT prolongation ratio, where a ratio, and calculating a PT to aPTT prolongation ratio, where a ratio at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.

The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4G2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary anajoplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a vecine against nematode parasites.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    à
                                                The present sequence is the Ancyclostoma ceylanicum nematode-extracted anticoagulant protein AceNAP4d2. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes or as diagnostic tests. The protein can also be used as a proceding against nematode parasites. has selective inhibitory activity for factor VIIa/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIa/TF selective inhibitory activity. The method comprises determining the time to clotting effected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo protogation of clotting effected by the isolated protein in each of prolongation of clotting effected by the isolated protein in each of the prolongation of clotting is calculated are prolongation of clotting is calculated as fold elevation of clotting time relative to a baseline clotting value, where a doubling of clotting time is deemed a two-fold elevation; and calculating a PT to appropriate the isolated as the each are are at a train at least one is indicative of factor VIIa/TF inhibitory activity. The method is useful for determining if a protein has factor VIIa/TF inhibitory activity
                                                                                                                                                                                                                                                                                       ü,

Eroteins with anticoagulant and/or serine protease inhibitory activity, isolated from nematodes, are useful to inhibit blood coagulation. The proteins can be added to blood collection tubes defining the collection of proteins can be added to blood collection tubes defining the collection of mammalian plasma. They are also useful to prevent or inhibit the collection of the proteins can serve as immunogens to raise antibodies for use in the diagnosis and identification of NAP conco. levels in biological fluids, e.g. to detect mammalian infection with a parasitic worm. They can also be used as manual infection. The proteins may double the clotting time of human plasma of the proteins in prophylactic and therapeutic vaccines against parasitic worm infection. The proteins may double the clotting time of human plasma in activated partial thrombin time assays when present at 10-10 nMol. The anticoagulant proteins are pref. Gerived from Ancylostoma canimum, A. ceylanicum, A. duodenale, Necator americanus of From Ancylostoma canimum, A. ceylanicum, pref. have 2 NAP domains and specifically inhibit the catalytic activity of the factor vira/Fromplex in the presence of factor Xa or a catalytically inactive factor Xi and deriv, do not specifically inhibit the activation of factor vira in the absence of TF and do not specifically inhibit the activation of factor vira in the absence of TF and do not specifically inhibit the activation of factor vira in the absence of TF and do not specifically inhibit the activation of factor vira in the absence of TF and do not specifically inhibit the activation of factor vira in the

```
The present sequence represents a nematode extracted anticoagulant conditions of protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF. The specification describes a method for screening an isolated protein at least one domain contract actor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting deflected by a concentration of the isolated protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (APT) assay and an ex vivo activated partial thromboplastin time (APT) assay, alturated partial thromboplastin time (APT) assay, and an ex vivo prothrompin isolated protein in each of the PT and aPTT assay, with respect to a baseline clotting value for each clotting time relative to a baseline clotting value, where a coubling of clotting time is deemed a two-fold elevation; and calculating a PT to appropriation ratio, where a ratio at least one is indicative of factor VIIA/TF inhibitory activity. The method is useful for determining in a protein has factor VIIA/TF inhibitory activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        5 QCGENEKYDSCGSKECDKKCKYDGVEEEDD - - EEPNVPCLVRVCHQ - - DCVCEEGFYRNK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                    The present sequence represents a nematode extracted anticoagulant protein (NAP). The protein has activity as an anticoagulant and/or serine protein (NAP). The protein contains at least one NAP domain which has selective inhibitory activity for factor VIIA/TF. The specification describes a method for screening an isolated protein at least one domain for factor VIIA/TF selective inhibitory activity. The method comprises determining the time to clotting an isolated protein at least one domain continued protein in an ex vivo prothrombin time (PT) assay and an ex vivo activated partial thromboplastin time (aPT) assay and an ex vivo activated partial thromboplastin time (aPT) assay and an ex vivo activated partial thromboplastin time (aPT) assay, and apTT assay, with respect to a baseline clotting value for each assay, where prolongation of clotting is calculated as fold elevation of clotting time is deemed a two-fold elevation; and calculating a PT to apTT prolongation ratio, where a ratio, where a doubling of factor VIIA/TF inhibitory activity. The method is useful for determining if a protein has factor VIIA/TF inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               6 CGENEKYDSCGS-KECDKKCKYDGVEBEDDEEPNVPCLVRVCHQD--CVCEEGFYRNKDD 62

New cDNA molecule encoding a protein having factor Xa inhibitory activity for preventing and treating blood clotting disorders, comprises nematode-extracted anticoagulant protein domains.

Disclosure; Fig 16; 197pp; English.

The present sequence is the Ancyclostoma caninum nematode-extracted anticoagulant protein AcaNaP44. Proteins of this kind have been shown to be effective at preventing blood clotting without causing excessive bleeding. The protein can be used in blood collection tubes to aid the isolation of plasma from the blood, to prevent thrombosis which may be linked to the rupture of an atherosclerotic plaque, acute myocardial infarction, angina, thrombolytic therapy, percutaneous transluminal coronary angioplasty, disseminated intravascular coagulopathy, infection, cancer and septic shock, and to produce antibodies. In the latter instance, the antibodies can be raised in order to detect infection by nematodes (the coding sequence can also be used for this) or as diagnostic tests. The protein can also be used as a vaccine against nematode parasites. (Updated on 06-AUG-2003 to correct OS field.)

Sequence 59, Application US/09249448

Patent No. 6121435

GENERAL INFORMATION:
APPLICANT: Vlasuk, George Phillip
APPLICANT: Stanssens, Patrick Eric Hugo
APPLICANT: Larwereys, Marc Josef
APPLICANT: Laroche, Yves Rarc Josef
APPLICANT: Laroche, Ves Rarc Bephane
APPLICANT: Gansemans, Yannick Georges Jozef
APPLICANT: Moyle, Matthew
APPLICANT: Moyle, Matthew
TITLE OF INVENTION: NEMATODE-EXTRACTED SERINE PROTEASE
TITLE OF INVENTION: INHIBITORS AND ANTICOAGULANT
NUMBER OF SEQUENCES: 356
CORRESPONDENCE ANDRESS:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted to the EMBL Data Library, February 1996
A; Description: The sequence of C. elegans cosmid C25E10.
A; Reference number: Z18376
A; Accession: T15609
A; Status: preliminary, translated from GB/EMBL/DDBJ
A; Molecule type: DNA
A; Residues: 1-137 < BRA>
A; Residues: 1-137 < BRA>
A; Residues: Leferences: EMBL:U50311; NID:g1226295; PID:g1226303; PIDN:AAA92313.1; CESP:C25E1: A; Experimental source: strain Bristol N2

VLDL receptor precursor - African clawed frog
N;Alternate names: very low density lipoprotein receptor; vitellogenin receptor
C;Species: Xenopus laevis (African clawed frog)
C;Date: 14-Aug-1998 #sequence_revision 14-Aug-1998 #text_change 16-Jun-2000
C;Accession: JC4858

"Primary structure and properties of the cathepsin G/chymotrypsin inhibitor from the larval hemolymph of Apis mellifera.";
Eur. J. Blochem. 262:6807(1999).
-!- FUNCTION: Chymotrypsin and cathepsin G inhibitor.
-!- SUBCELLULAR LOCATION: Secreted.
-!- SIMILARITY: Contains 1 IIL (Trypsin inhibitory-like) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DOMAIN: During sperm migration through the reproductive tracts, the mucin-like domain might inhibit inappropriate trapping of spermatozoa or promoting adhesion to the oviductal istimus. DOMAIN: The VWFD domain 2 may mediate covalent oligomerization (by similarity to human intestinal mucin MUC2).

SIMILARITY: Contains 4 VWFD domains.
SIMILARITY: Contains 1 EGF-like domain.
CAUTION: Ref.2 sequence differs from that shown due to transposition of a number of exons.

                                                                                                                                                                                                                                                                                                                                                                                                                                 PTM: Cleaved (Probable).

PTM: Five disulfide bonds are present. When artificially cleaved by thermolysin between Asn-56 and Ile-57, the two obtained chains (called heavy and light chins) remain linked.

                                                                                                                                                signaling.

-!-SUBGNIT: Probably forms covalent oligomers.
-!-DOMAIN: Probably forms covalent protein, exclusively on the apical region of the sperm head.
-!-ISSUE SPECIFICITY: In testis, primarily in haploid spermatids.
-!-DOMAIN: The MAM domains probably mediates sperm adhesion to the zona pellucida.
-!-DOMAIN: During sperm migration through the reproductive tracts, the mucin-like domain might inhibit inappropriate trapping of spermatozoa or promoting adhesion to the oviductal isthmus.
-!-DOMAIN: The VWFD domain 2 may mediate covalent oligomerization (by similarity to human intestinal mucin NUC2).
-!-SIMILARITY: Contains 3 MAM domains.
-!-SIMILARITY: Contains 1 EGF-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         EMBL, U97068; AAC26680.1; -...

Complexes and vitellogenin.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- SIMILARITY: Contains 35 LDL-receptor class A domains.
-!- SIMILARITY: Contains 17 EGF-like domains.

The canine von Willebrand factor gene: sequence and expression of
a region encoding the glycoprotein ID/IX blinding domain.";
a region encoding the glycoprotein ID/IX blinding domain.";

C. I FUNCTION: Important in the maintenance of homeostasis, it
participates in platelet-vessel wall interactions by forming a
noncovalent complex with coagulation factor VIII at the site of
vascular injury (By similarity).

C. I ISSUE SPECIFICITY: Blood.
C. I TISSUE SPECIFICITY: Blood.
C. INTERCHAIN DISULFIDE BONDS (BY SIMILARITY).
C. SIMILARITY: Contains 3 VWFC domains.
C. SIMILARITY: Contains 3 VWFC domains.
C. SIMILARITY: Contains 1 C-terminal cystine knot-like (CTCK) domain.
C. SIMILARITY: SOME, TO SILKWORM HEMOCYTIN.
